# Muizz Opeyemi Jamiu

**Frontend Engineer**

Lagos, Nigeria · +234 812 416 4597 · opeyemimuizz@gmail.com · linkedin.com/in/muizz-opeyemi · github.com/spr-tech

## Professional Summary

Frontend Engineer building fast, accessible and maintainable web applications with React, Next.js, TypeScript and Tailwind CSS. I think beyond the interface: clear requirements, sound data models, security and how a system behaves when things fail. Trained in system design, cloud deployment and backend fundamentals through a selective engineering fellowship, with a particular interest in fintech, where precision and reliability matter most.

## Experience

### Software Engineering Fellow (Frontend Specialisation) — TeSA Africa, Univaciti

*2026 – Present · Lagos, Nigeria*

- Selected as one of 67 fellows from over 9,000 applicants for Cohort 6 of an intensive programme covering software engineering, cloud engineering, DevOps (Development and Operations), presentation skills, basic accounting and data analytics
- Designed, built and deployed Chowly, a dine-in restaurant ordering platform covering menu browsing, ordering, live wait times, waiter workflows, ratings and payment, using Next.js, TypeScript, Prisma, PostgreSQL and Tailwind CSS; modelled the data before writing code and deployed on Vercel
- Authored an architecture decision dossier for a national exam results and certificate verification platform, covering business, product and functional requirements, a nine-month plan for a six-engineer team, C4 architecture diagrams, eight Architecture Decision Records, an API (Application Programming Interface) contract and a data model with predicted query plans; scored 96/100
- Designed an idempotent payment flow with request identifiers and automatic reconciliation to prevent double charges from a payment partner that lacked idempotency support
- Diagnosed a simulated production failure on a food-delivery platform and redesigned its order and payment flow using idempotency keys, state machines, cache stampede prevention and queue-based email with retries, backoff and dead-letter handling
- Deployed applications to AWS (Amazon Web Services) EC2 (Elastic Compute Cloud) and Render in hands-on cloud labs, collaborating in a pair through Git branching and pull requests
- Presented and defended design decisions in facilitator reviews, explaining trade-offs and rejected alternatives

### Frontend Developer Intern — RWA Inc

*April 2026 – October 2026 · Remote*

- Built the dashboard for Enter, an AI-native cloud IDE (Integrated Development Environment), including a chat interface, a project management flow and a connectors system, in Next.js and TypeScript
- Developed a Projects page with grid and list views, a Connectors page with dynamic integration management, and Connector detail pages with real-time connect and disconnect
- Implemented static and dynamic routing with the Next.js App Router (for example `/connectors/[id]`) to keep the page architecture scalable
- Built reusable UI (User Interface) components with React, TypeScript and design tokens following a shared design system
- Translated Figma designs into responsive, pixel-accurate interfaces consistent across the product
- Collaborated with a distributed team through Git branching, pull requests, code review and conflict resolution on GitHub

### Frontend Developer Intern — STX Technology

*May 2025 – November 2025 · Lagos, Nigeria*

- Developed and maintained user-facing websites with React, JavaScript, HTML and CSS
- Built reusable components that were shared across multiple projects
- Created responsive layouts that worked across mobile, tablet and desktop
- Integrated REST (Representational State Transfer) APIs with backend developers to connect interfaces to live data
- Diagnosed and resolved user-reported issues on live web pages

## Projects

**Chowly — Restaurant Ordering Platform** · chowly-sand.vercel.app Next.js, TypeScript, Prisma, PostgreSQL, Tailwind CSS

- Full-stack ordering flow from menu to payment, with separate customer and waiter experiences and order states tracked end to end

**Takarda — Architecture Decision Dossier** · github.com/spr-tech/takarda-decision-dossier System design, requirements engineering

- Results platform designed to stay affordable under a national results-day traffic spike, with tamper-proof result amendments enforced at the database level

**Smart Energy Consumption Dashboard** React, TypeScript, Tailwind CSS

- Built from scratch with API integration, data visualisations of usage over time, goal tracking and deployment

## Technical Skills

- **Languages:** JavaScript (ES6+), TypeScript, HTML, CSS
- **Frontend:** React, Next.js (App Router), Tailwind CSS, React Router, responsive design, accessibility, performance optimization
- **Backend and data:** PostgreSQL, Prisma, REST API design and integration, data modelling
- **Cloud and DevOps:** AWS EC2, Render, Vercel, Git and GitHub workflows
- **System design:** requirements documentation (business, product and functional), Architecture Decision Records, idempotency, caching, message queues, failure handling
- **Tools:** VS Code, Cursor, Figma, Jira, Plane

## Education

**Bachelor of Science (Education)** — University of Ilorin *December 2018 – October 2023 · Ilorin, Nigeria*
